SLOW RELEASE
LAWN FERTILISER

Amgrow Lawn Connoisseur

For professional results, use the fertiliser the professionals use. Slow release fertilisers encourage a more consistent growth habit than immediate-release fertilisers and you will love your lawn because of it.

- Controlled release for up to 16 weeks maintains consistent growth habit and reduces mowing frequency, clippings and pest problems.
- A controlled and more uniform release maximises nutrient uptake efficiency and minimises fertiliser loss due to leaching and volatilisation.
- Harder, more durable coating resists breakage during handling and application.
- Free flowing product is easier to handle and apply.
- The technology provides more controlled release nitrogen than any other sulphur coated urea product.
