

Native Fertiliser

What is Ecosmart Technology?

Ecosmart is a unique bio-active compound fertiliser. It combines the benefits of both synthetic and organic fertilisers in the one homegenous granule with the addition of moisture retention compounds to enhance nutrient performance.

The Compound fertiliser component makes up the synthetic fraction of the product, enabling the Ecosmart technologies to possess a much higher nutrient analysis over conventional organic based products. As a result, Ecosmart is comparable in nutrient value to current synthetic fertiliser options in the home garden segment.

The organic component of the product is a lignite material, which is high in carbon & humic acids and also possesses a high cation exchange capacity which optimises soil microbial activity and nutrient use efficiency. The third component of the product is the Polyacrylamide (PAM) coating. Polyacrylamides are large polymer molecules, which assist in optimising water retention in the soil and help flocculate soil particles, improving soil structure.

Key Points:

- A balanced formulation of essential nutrients specifically formulated for all native trees & shrubs
- Low in phosphorus as native plants have generally developed on poor, low phosphorus soils and have the ability to obtain adequate phosphorus when phosphorus levels are low
- Added Wetting Agent
- Contains NutriPlus, a unique bio-active compound fertiliser which is high in carbon and humic acids. This component enhances nutrient uptake, increases soil organic matter & improves overall soil health.

Pack Size: 2.5kg, 5kg
